**Adjusting table and chair optimally**

**Chair height**
Adjust the height of your chair so that your feet are flat on the floor. Your legs should be bent at an angle of at least 90°.

**Seat**
The seat should be adjusted so that your back presses lightly against the chair back. There should be, however, a small gap between the seat and the backs of your knees – the width of around two fingers.

**Chair back**
The chair back should be adjusted so that you can lean back without exerting any strength. It should, however, provide enough resistance so that the curve provides support in the small of the back when sitting upright.

**Lumbar support**
Your office chair has a curved chair back. Adjust the height of your chair back so that the curve is at the small of your back. This encourages good posture. Some models allow you to adjust the height of the back support without changing the height of the chair back.

**Armrests (optional)**
Sit upright in your chair and adjust the armrests so that your elbows rest lightly on the armrests without having to raise the shoulders. Armrests are not absolutely necessary.

**Table height**
When you are sitting upright in your chair, the table height should be adjusted so that you can rest your elbows on the table without raising your shoulders.
Installing working tools optimally

Monitor
Place your monitor directly in front of you so that you do not need to turn your head sideways. The height should be set so that the top of the screen is a hand’s width below the level of your eyes.

The distance between your eyes and the screen should be at least an arm’s length, a little more if you have a large screen. Do not bring the monitor closer if you cannot see text clearly. Instead, increase the type size in your programme.

Keyboard and mouse
The keyboard should be directly in front of you. The distance to the table edge should be between 10 and 15 cm so that you can rest the heels of your hands on the table. Place your mouse as close as possible to the keyboard.

Documents
Take care to place documents between the keyboard and the monitor and not between the table edge and the keyboard. If possible, the keyboard, document and monitor should be aligned.
